When we theoretically describe nanodevice we have to treat the whole quantum system as two subsystems: small finite fragment of the system containing nanodevice (cluster) and the rest of the system containing electrodes. Problem "cluster in the field of the rest of system" is successfully solved in the frameworks of embedded molecular cluster (EMC) model with *orthogonal* wave functions. We have modified EMC model treating cluster embedding problem in the frameworks of one-electron approximation with *non-orthogonal* wave functions. We have proposed new cluster embedding scheme based on our approach [1].

Our present aim is application of our cluster embedding method for quantum-chemical modelling of processes in nanosystems and calculation of electrical properties of nanodevices. One of the approaches for theoretical description of nanodevices is quantum transport theory developed by Gross with co-workers [2]. We study possibility to combine our approach with approach of Gross et al [2] based on time-dependent DFT (TDDFT). We demonstrate [3] that our cluster embedding method is compatible with DFT Kohn-Sham method. We conclude that our embedding scheme may be combined with TDDFT if electron transitions are described correctly: occupied and vacant cluster states are localized in the cluster region in the same manner. To get occupied and vacant states of the same localization degree, we have modified [4] our initial cluster embedding equations [1]. We demonstrate that our cluster embedding method is compatible with electric current calculation method based on TDFT [2] and propose approach for calculation of electric parameters of nanodevices. Possibilities of our approach for theoretical modelling of nanodevices from the first principles are discussed.
